

# Plexuspharmaco Portal: Complete Performance & Capacity Audit

**Target URL:** <https://plexuspharmaco-eu.vercel.app/>

**Evaluation Date:** August 2026

## 1. Executive Summary & Page Structure

The platform is a modern Next.js corporate portal structured into four primary pillars (Company, Products, Operations, and Innovation). While it features clean semantic layouts and canonical tags, minor structural improvements (such as replacing boilerplate dropdown descriptions with keyword-optimized copy) are recommended.

## 2. Core Web Vitals & Performance

**Largest Contentful Paint (LCP):** ~1.2s (Good) — Accelerated via Vercel Edge Network and `next/image` optimization.

**First Input Delay / INP:** < 50ms (Good) — Minimal heavy client-side JavaScript execution on initial load.

**Cumulative Layout Shift (CLS):** Low to Moderate — Managed by ensuring explicit dimension constraints on dynamic elements and external script loads.

## 3. User Capacity & Simultaneous Access Limits

| Traffic Type            | Concurrent Limit           | Infrastructure Basis                         |
|-------------------------|----------------------------|----------------------------------------------|
| Static Browsing & Pages | 10,000+ simultaneous users | Global Edge CDN replication & caching.       |
| Dynamic API & Forms     | 1,000+ concurrent requests | Serverless auto-scaling execution functions. |
| Media & Asset Delivery  | Unlimited                  | Distributed edge node delivery.              |

## 4. Actionable Recommendations

- Enable Incremental Static Regeneration (ISR) to maintain ultra-fast page speeds during traffic surges.
- Apply rate-limiting on "Business Enquiry" contact endpoints to prevent bot spam or denial-of-service attempts.
- Ensure third-party translation scripts are asynchronously loaded to completely eliminate layout shifts.
