

Interface & UX Audit: Identified Issues & Corrections

1. Cumulative Layout Shift (CLS) in Navigation

Issue: Expanding mega-menus in the header may cause content below to "jump" unexpectedly when the container height changes on interaction.

Correction: Use fixed-height wrappers or absolute positioning for dropdown content to prevent the document flow from shifting when menus open.

2. Third-Party Widget Injection

Issue: Google Translate and other external widgets injecting DOM elements can cause the navigation header layout to shift slightly during initial load.

Correction: Assign a dedicated, fixed-dimension container for the widget to reserve space before the script finishes loading.

3. Mobile Touch Accessibility

Issue: Compact padding on footer/secondary menu links makes them difficult to tap accurately on mobile devices.

Correction: Apply a minimum 48px height/width touch target area to all interactive navigation elements.

4. Redundant UI Copy

Issue: Identical descriptive text is reused across different dropdown categories, reducing clarity and SEO impact.

Correction: Audit each menu dropdown to ensure descriptions are unique and accurately reflect the destination page content.
