

Website Performance & Quality Audit: Plexuspharmaco

1. Executive Summary

The Plexuspharmaco website (plexuspharmaco-eu.vercel.app) functions as a clean, structured corporate portal. It effectively utilizes a modern framework (Next.js) and adheres to a logical, segmented navigation structure suitable for a B2B pharmaceutical company.

2. Performance Observations

Based on the architectural structure detected:

- **Framework:** Built with Next.js, which is optimized for fast loading and SEO performance.
- **Asset Management:** Use of `next/image` components ensures responsive images (serving appropriate resolutions via `srcset`), which is critical for performance.
- **Preloading:** The site utilizes `rel=preload` for fonts and chunks, indicating a focus on reducing Time to First Meaningful Paint.

3. Navigation & Structure Audit

The site navigation is categorized into four logical pillars (Company, Products, Operations, Innovation). This is intuitive for B2B users.

Section	Assessment
Navigation Pillars	Excellent – clearly defined separation of concerns.
User Path	Clear progression from "Products" to "Business Enquiry".
SEO Foundation	Canonical links and meta-data structures are present.

4. Identified "Mistakes" & Recommendations

Note: These are observations based on standard web practices, not functional bugs.

- **Content Placeholders:** Several internal descriptions (e.g., in the header dropdowns) repeat the exact same placeholder text: *"Explore our comprehensive offerings and commitment to advancing global healthcare through innovation and quality."* This is a missed opportunity for SEO keywords specific to those pages.
- **Empty Hidden Divs:** The source code contains several empty div elements (e.g., `<div hidden></div>`, `<div></div>`). While harmless to the user, cleaning up the DOM improves code maintainability.
- **Translation Logic:** The Google Translate element integration is a good feature but ensure it is correctly initialized to avoid layout shifts on first load.
- **Language Selection:** The "Select Language" section in the menu appears to be missing an active dropdown/selector implementation in the current view.
