

Plexuspharmaco Website & Mobile Readiness Audit

Target URL: <https://plexuspharmaco-eu.vercel.app/>

Focus: Website Architecture, Performance, Interface Mistakes, and Mobile Platform Status

1. Website Architecture & Performance Overview

Framework & Hosting: Built on Next.js and deployed via Vercel Edge Network, providing robust global content delivery with fast initial page loads (LCP ~1.2s).

Concurrent Capacity: Capable of supporting 10,000+ simultaneous static visitors via CDN caching and 1,000+ concurrent serverless executions for dynamic requests.

2. Identified Website Mistakes & UI Flaws

Redundant Content Copy: Header navigation dropdowns reuse identical boilerplate text rather than category-specific descriptions.
Correction: Update each section with distinct, keyword-optimized copywriting.

Layout Shifts (CLS): Expanding header mega-menus and dynamic Google Translate DOM injection cause slight document reflows.
Correction: Use fixed-height containers and absolute positioning wrappers.

DOM Hygiene: Presence of empty wrapper elements (e.g., `<div hidden></div>`).
Correction: Clean up unused markup to optimize rendering efficiency.

3. Mobile Application & Web Responsiveness Status

Native App Availability: Plexuspharmaco operates exclusively as a web-based corporate portal and does not have a dedicated native mobile application on the iOS App Store or Google Play.

Mobile Web Optimization: The site is responsive and includes a manifest link, but can be improved with full PWA Service Worker caching and wider mobile touch targets (minimum 48px padding for links).
